

Newtonberg Engine's Modules

RSS

RSS format will allow you to provide the latest updates in your portal, making it unnecessary to visit your site on a daily basis as several applications will be able to read such information.

Mail lists

Module which allows the integration with other applications in order to generate mail lists in a simple way. This translates into an e-mail address which sends a message to multiple receivers.

Mobile phones

Module that allows to have the documents and taxonomies present in a portal represented as simple text so that the site is browsable using mobile phones.

Print-outs

Functionality that allows the generation of a PDF file from the contents shown in another website. In other words, it transforms the HTML in your webpage so that it can be read in a PDF format.

Search

This module allows the generation of fulltext searches over all the documents in a portal or site group, and also over its taxonomies. This tool also allows the incorporation of keywords to do a finer search result.

Newsletter

This module allows the manual or automatic creation of your site's content package so that it is sent in a newsletter via e-mail in a plain text format. This content may appear with a heading, a title and a summary, along with a direct link to the document in order to be read in its entirety.

Exporting

This allows the export of the XML content present in the repository of any website which was created using Newtonberg Engine©. This way, the content is recognised on any other platform in a simple and fast way.

Forms

Module which allows the creation of any form or survey on the web, namely, subscribing to a newsletter, sending documents, contact, generation of questions with a single answer, etc.

Web

Module which contains a library of standard representations on the web to display the information present in a portal in a simple, fast and easy way.

Javascript

This module permits to generate javascript code from parts of a website generated with Newtonberg Engine© so that they are posted and shown in other portals as content capsules.

Dialogues

This allows the creation of multiple chat rooms or forums in which people can vote. The forums may be about a single document, a taxonomy, or a general room for the whole site. The advantage in the dialogue rooms by Newtonberg Engine© is that the voting system allows the participation of passive users whose thoughts are represented by an opinion and, at the same time, the opinion which has the most support is ranked, showing which one is the most popular. Furthermore, the different dialogue rooms may coexist in the same site and the user may choose in which room he or she will express their opinions.
